

## Feedback for Project Number 20

### Instructions

Use the program below (beginning line 13) to figure out who you will be critiquing. You will critique two of your colleagues' work and provide feedback for them to produce their best work. Make sure you use *your number as it aligns with the Google Document's Position Number column* in the program below (line 16). Remember this is to help them out so do not be mean, but also do not hold back. Be sure to highlight areas of success as equally as areas of failure. Use the template below the code to provide them this feedback. You can find the [project links here](#)

**Be sure to change the name of the project in the title above and in the document title.** This is the project number you are critiquing and should be included in the output file so that the document name reads 'Critique\_of\_Project##.docx'. Once you are finished, e-mail me both documents (one document per critique) and I will upload them to the 'Peer\_Reviewed\_Work' folder so that your peers can view them. Do not e-mail me the .Rmd file. These reviews are due by **Sunday, May 9th at 11:59pm CST**. For ease you can use this markdown file to fill out your responses and knit which will produce a word document for you.

### Feedback Below

#### What did you first notice about this project?

It's simplistic in design with not too many options, but the result is that it looks very clean and organized.

#### What was this project's main story?

It doesn't have a narrative, per se, but it allows you to tailor the details of the technical analysis you apply to a stock ticker, so you can frame your own story depending on how you interpret the data you're looking at

#### What were some areas of improvement?

I think for what it is, it's really cool and handy, there could just be a couple more bells and whistles:

#### What elements would you add to this project?

Some of the whitespace below could be utilized by displaying statistics about the stock like EPS, Cost Basis etc. It would also be cool if that info could be updated by hovering the mouse over a certain point on the graph.

It would also be cool if you could plot more than one stock at a time, or at least some benchmark indices.

**What were some successful elements of this project?**

It works very smoothly, and is up-to-date to the current day

**Any other thoughts you would like to convey to your peer?**

This is cool, I would use this if I looked at stock performance very often, because bigger websites like Yahoo or Fidelity are choked with menus and extra steps.
